3 Evaluations

- Parsing results
- Gold standard evaluations
- Dependency Parsing

4 Final Remarks

Heads in Constituency Structures

The role of heads in syntax

 Heads are a central concept in linguistic theories and NLP techniques.

Heads in Constituency Structures

The role of heads in syntax

- Heads are a central concept in linguistic theories and NLP techniques.
- In constituency structures, the term is used to mark, for any non-terminal node, the specific daughter node that fulfills a special role.

Heads in Constituency Structures

The role of heads in syntax

- Heads are a central concept in linguistic theories and NLP techniques.
- In constituency structures, the term is used to mark, for any non-terminal node, the specific daughter node that fulfills a special role.
- Exactly one head per constituent.

Heads in Constituency Structures

The role of heads in syntax

- Heads are a central concept in linguistic theories and NLP techniques.
- In constituency structures, the term is used to mark, for any non-terminal node, the specific daughter node that fulfills a special role.
- Exactly one head per constituent.

Federico Sangati & Willem Zuidema Unsupervised Methods for Head Assignments

Heads in Constituency Structures

Heads in linguistic theories

Zwicky (Journal of Linguistics, 1985) lists the conditions a daughter has to fulfill in order to be the head of a construct, according to linguistic theories.

- 1 Is the constituent the semantic argument, that is, the constituent whose meaning serves as argument to some functor?
- 2 Is it the determinant of concord, that is, the constituent with which co-constituents must agree?
- 3 Is it the **morphosyntactic locus**, that is, the constituent which bears inflections marking syntactic relations between the whole construct and other syntactic units?
- 4 Is it the subcategorizand, that is, the constituent which is subcategorized with respect to its sisters?
- 5 Is it the governor, that is, the constituent which selects the morphological form of its sisters?
- 6 Is it the distributional equivalent, that is, the constituent whose distribution is identical to that of the whole construct?
- 7 Is it the **obligatory** constituent, that is, the constituent whose removal forces the whole construct to be recategorized?
- 8 Is it the ruler in dependency theory, that is, the constituent on which others depend in a dependency analysis?

Heads in Constituency Structures

Heads in NLP

 Heads are relevant for many NLP applications (parsing, MT, SRL, ...).

Heads in Constituency Structures

- Heads are relevant for many NLP applications (parsing, MT, SRL, ...).
- Heads are used because they work!

Heads in Constituency Structures

- Heads are relevant for many NLP applications (parsing, MT, SRL, ...).
- Heads are used because they work!
- Serve to have better probability distributions over the productive rules.

Heads in Constituency Structures

- Heads are relevant for many NLP applications (parsing, MT, SRL, ...).
- Heads are used because they work!
- Serve to have better probability distributions over the productive rules.
- Little attempt to have empirical (corpus based) evaluation of head assignments (only exception Chiang & Bikel 2002).

Heads in Constituency Structures

- Heads are relevant for many NLP applications (parsing, MT, SRL, ...).
- Heads are used because they work!
- Serve to have better probability distributions over the productive rules.
- Little attempt to have empirical (corpus based) evaluation of head assignments (only exception Chiang & Bikel 2002).
- Our goal is to contribute to both theory and applications, by providing algorithms for head assignments, and propose empirical evaluations.

Rule-based methods LTSG Unsupervised Learning of Heads

Hand-written rules

• Predefined rules based on the labels of parent, daughters, and their positions.

Rule-based methods LTSG Unsupervised Learning of Heads

Hand-written rules

- Predefined rules based on the labels of parent, daughters, and their positions.
- Language and corpus specific.

Rule-based methods LTSG Unsupervised Learning of Heads

Rule-based methods LTSG Unsupervised Learning of Heads

LTSGs

Lexicalized Trees + substitution operation = LTSG

• Corpus + Heads \rightarrow LTSG

• LTSGs belong to the family of TSGs (as CFGs and DOP).

Rule-based methods LTSG Unsupervised Learning of Heads

LTSGs

Lexicalized Trees + substitution operation = LTSG

- Corpus + Heads \rightarrow LTSG
- LTSGs belong to the family of TSGs (as CFGs and DOP).
- As all other TSGs, LTSGs can be defined within a stochastic model.

Rule-based methods LTSG Unsupervised Learning of Heads

Learning heads through LTSGs

• Given a corpus, there is a one to one mapping between head assignments and LTSGs we can extract.

Rule-based methods LTSG Unsupervised Learning of Heads

Learning heads through LTSGs

- Given a corpus, there is a one to one mapping between head assignments and LTSGs we can extract.
- We define an objective function over LTSGs, based on statistical information over the lexicalized trees.

Rule-based methods LTSG Unsupervised Learning of Heads

Learning heads through LTSGs

- Given a corpus, there is a one to one mapping between head assignments and LTSGs we can extract.
- We define an objective function over LTSGs, based on statistical information over the lexicalized trees.
- Choosing a head assignment = find the LTSG which optimizes the function.

Rule-based methods LTSG Unsupervised Learning of Heads

Learning heads through LTSGs

- Given a corpus, there is a one to one mapping between head assignments and LTSGs we can extract.
- We define an objective function over LTSGs, based on statistical information over the lexicalized trees.
- Choosing a head assignment = find the LTSG which optimizes the function.
- **Unsupervised**: we don't learn from any given gold head assignment.

Rule-based methods LTSG Unsupervised Learning of Heads

FAMILIARITY MAXIMIZATION

 Use elementary trees which are general enough to occur in many possible constructions.

Rule-based methods LTSG Unsupervised Learning of Heads

FAMILIARITY MAXIMIZATION

- Use elementary trees which are general enough to occur in many possible constructions.
- We start by collecting bag of all lexicalized trees from the training corpus, consistent with any head annotation.

Rule-based methods LTSG Unsupervised Learning of Heads

FAMILIARITY MAXIMIZATION

- Use elementary trees which are general enough to occur in many possible constructions.
- We start by collecting bag of all lexicalized trees from the training corpus, consistent with any head annotation.

Rule-based methods LTSG Unsupervised Learning of Heads

FAMILIARITY MAXIMIZATION

• We assign heads in a greedy TOP-DOWN manner: for each node we select the most frequent lexical tree rooted in it.

Rule-based methods LTSG Unsupervised Learning of Heads
